CatSpring

CatSpring is a flow-through drinking trough for cats and dogs. It features a quiet, energy efficient 5 V safe pump with IPX8 rating, a sensor to prevent the pump from running "dry" and an LED to indicate insufficient water level for proper pump operation. The large storage capacity (0.66 US gal) means that the water in the device does not need to be refilled often, although it is recommended to change it daily and clean the trough at least once every 7 days. The water in the tank is cleaned by an attached filter with two layers: the sponge traps hair and the activated carbon removes any unpleasant taste and smell.

CatSpring is equipped with a function emergency water storage at the top level of the container, ensuring that your pet will have uninterrupted access to water even in the event of a power failure. The way the drinking trough works can be adjusted to your pet's needs. If your pet is intrigued by the movement of the water, you can choose a mode where the water flows from a decorative splash element like a fountain. When the splash element is removed, the water is still moving, but it flows more calmly – it also has a higher oxygen content.

The CatSpring drinking trough is recommended for all cats and dogs, especially the elderly, those suffering from urinary tract disorders, those fed dry food and those who show reluctance to drink water from a traditional bowl. It guarantees your pets constant access to filtered water, which can have a positive impact on their health. Its minimalist, universal design and decorative water splash element make it an original decoration for the apartment. CatSpring is manufactured in Poland, which ensures the quality and safety of materials, serviceability and availability of replaceable filters.
